```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence ampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Direct Submission

```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        misc_feature
        The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send mailto:egreen@nhgri.nih.gov/ or see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                   The clone sequenced to the left is GS1-117B4, 2000 bp overlap, the clone sequenced to the right is GS1-13M19, 2000 bp overlap. Actual start of this clone is at base position 25835 of GS1-117B4, actual end is at base position 49313 of GS1-13M19.
                                                                                                                                                                      The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genemics 51:1-8. The clone may be obtained either from and coworkers at http://www.resgen.com) or Pieter de Jong VECTOR: pBACe3.6
                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphisms have been identified between AC023105 and AC079780.

* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

## MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nh.gov/DIR/GTB/CHR7, send mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

SOURCE INFORMATION: The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E.

                                                                                                             NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP13-492C18; the clone sequenced to the right is RP11-10F11, 2000 bp overlap. Actual start of this clone is at base position 1 of RP11-760D2; actual end is at base position 1 of RP11-10F11.
                                                                                                                                                                                          The region from 20341 to 20385 is covered only by a pcr product from clone DNA. An unresolved simple sequence repeats exists and between 84203 and 84724. Polymorphisms exists between AC024199 and AC092447. Data from AC024199 and AC092447.
Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             note="match to EST A1334287 (NID:g4070846) gq25e08.x1" 4411. 14446

Nucleotides representing cancer-associated genes, used to develop products for the diagnosis, monitoring and treatment of cancers

Claim 108; Page 13; 44pp; English

```
This invention describes a novel isolated polypeptide (I) which comprising an immunogenic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polynucleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention
                                 pCR primers AA236155-56 were used to amplify a cancer associated antigen gene designated KOC-1. The specification also describes a cancer associated antigen designated CT7. The CT7 polymucleotide was isolated from SK-MEL-37 melanoma cells. The polypeptide has some homology with MAGB-10, limited to about 210 carboxy terminal amino acids. The amino terminal of the protein has a repetitive pattern, with repeats rich in the peptide given in AAV43877. The CT7 polypeptide can be processed to peptides which provoke lysis by cytolytic T cells. The polymucleotides and polypeptides can be used for treating a cancerous condition and screening for or diagnosing cancerous conditions. The cancer associated antigens can be used as an immunogenic or vaccine composition with an adjuvant, e.g. a cytokine, a saponin, or granulocyte macrophage-colony
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated polypeptide comprising an immunogenic portion of a lung tumor protein is used for detecting and monitoring progression of lung cancer

Human lung tumour proteins and polymuclectides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polymucleotides, antibodies, tusion proteins, T cell populations, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABL48959 to ABL43300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present
can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient are treated with P2, polynucleotides encoding P2 or antigen presenting cells expressing P2 and then administered to the patient to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polynucleotides encoding lung tumor polypeptides, useful for treating lung cancer or stimulating an immune response -

```

The present invention describes human lung tumour proteins. Human lung tumour proteins and polynucleotides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polynucleotides, antibodies, fusion proteins, T cell populations, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABL48959 to ABL49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes human lung tumour proteins. Human lung tumour proteins and polynuclectides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polynucleotides, antibodies, fusion proteins, T cell populations, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABL48959 to ABL49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present
                   Human; lung tumour; lung cancer; cytostatic; immunostimulant; vaccine; immune response; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotides encoding lung tumor polypeptides, useful for treating
lung cancer or stimulating an immune response -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence represents a cancer associated antigen gene designated KOC-1. The specification also describes a cancer associated antigen designated CT7. The CT7 polymucleotide was isolated from antigen designated CT7. The CT7 polymucleotide was isolated from SK-MEL-37 melanoma cells. The polypeptide has some homology with mager-10, limited to about 210 carboxy terminal amino acids. The amino series, proline, glutamine and leucine, and an almost invariable core of serine, proline, glutamine and leucine, and an almost invariable core of the peptide given in AAY43877. The CT7 polypeptide can be processed to and polypeptides can be used for treating a cancerous condition and and application with an attigens can be used as an immunogenic or vaccine composition with an attigens can be used as an immunogenic or vaccine composition with an adjuvant, e.g. a cytokine, a saponin, or granulocyte macrophage-colony stimulating factor (GM-CSF).
                                                                                                                                                                                                                                                                                                                                                                     ö

This invention describes a novel isolated polypeptide (I) which which which have cytostatic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polynucleotides are used in compositions and vaccines to inhibit the development of cancer, can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the are treated with P2, polynucleotides encoding P2 or antigen presenting development of cancer.
                         Isolated polypeptide comprising an immunogenic portion of a lung tumor protein is used for detecting and monitoring progression of lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cancer; colon; breast; ovary; oesophagus; kidney; thyroid;

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene [1] of a signature gene set, where [1] comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytoscatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical result of M1, and the data is sufficient to convey the chemical cancer and/or properties of the agent. M1 can be used in the conveythement of cancer such as colon, breast, stomach, lung, thyroid, cosephageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Horrigan S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 21; DB 24; Length 4181; 100.0%; Pred. The present invention describes human lung tumour proteins. Human lung tumour proteins and polynuclectides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polynuclectides, antibodies, tusion proteins, T cell populations, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABL48959 to ABL49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KOC; promoter; human; cytostatic; dermatological; vulnerary; tumour; chemocherapy; allogenic bone marrow transplant; pancreatic carctinoma; domain-containing protein overexpressed in cancer; immunostimulant; gene therapy; chronic pancreatitis; pluripotency; adjing; wound healing; radiation therapy; skin regeneration; cell differentiation; cancer; ds.

This invention describes a novel KOC (KH domain-containing protein overexpressed in cancer) promoter. The products of the invention have overexpressed in cancer) promoter. The products of the invention have cytostatic, dermatological, vulnerary and immunostimulant activity, are capable of modulating activity/expression of the KOC protein and can be used for gene therapy. The KOC promoter is also useful (i) for diagnosis used for gene therapy. The KOC promoter is also useful (i) for diagnosis of tumours that express KOC, particularly for differentiating between of themote panceatic carcinoma; (ii) to detect chronic panceatists and panceatic carcinoma; (iii) to detect cond (iii) to evaluate treatments; (iv) to impart pluripotency to cells; and (iii) to evaluate treatments; (iv) to impart pluripotency to cells; (v) to prepare tissues or organs (by differentiation of seem cells; (v) to prepare tissues or organs (by differentiation of seem cells; (vii) to improve ex vivo populations); (vi) in high-dose chemotherapy; (vi) to improve aging processes; (x) as prophylactic agents during chemotherapy/radiation processes; (x) as prophylactic agents during chemotherapy/radiation chemotherapy; (xi) to regenerate skin defects and accelerate wound healing, thoughing for cosmeller purposes; and (xi) to immunise against malignant chemotherapy; (xi) to regenerate skin defects and accelerate wound healing, thoughting for cosmeller precursor stages. The promoter can also be used (i) for the compare of feel differentiation of cells and tissues; (ii) to detect the degree of (ed) differentiation of cells and tissues; (ii) and (iv)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in gene therapy of cancer (for controlling protein expression); and (iv) to identify compounds, potentially useful in cancer treatment, that bind to the promoter and modulate its activity. The promoter makes possible generation of stem cells of any selected type. Since expression of KOC is not sensitive to other physiological states, e.g. inflammation, it represents a tumour marker with 100% sensitivity and specificity. This sequence represents the human KOC gene described in the disclosure of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                  New promoter of the KOC gene, useful for diagnosis and treatment of cancer, for inducing cellular dedifferentiation and for identifying modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; chromosome mapping; gene mapping; gene therapy; forensic;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence: tags for identifying expressed genes. (I) is useful in gene therapy techniques (I) creatore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. (IT) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. (IT) expression of a (II) are useful in medical disorders involving aberrant protein expression or biological activity. (IT) expression or biological activity. (IT) expression or biological activity. (IT) and into activity of agenetic alsorders or other traits to assess biodiversity amino acid sequences of the invention.

CC and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

CC diagnostic coding sequences of the invention.

CC diagnostic coding sequences of the invention.

CC Specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The invention relates to isolated polynucleotide (I) and

CC polypeptide (II) sequences. (I) is useful as hybridisation probes,

CC polymerase chain reaction (PER) primers, oligomers, and for chromosome

CC and gene mapping, and in recombinant production of (II). The

polynucleotides are also used in diagnostics as expressed sequence tags

CC in restore normal activity of (II) is useful in gene therapy techniques

CC or restore normal activity of (II) or to treat disease states involving

CC or supplement. (II) and its binding partners are useful in medical

maging of sites expressing (II). (I) and (II) are useful in medical

imaging of sites expressing (II). (I) and (II) are useful in medical

ca food supplement. (II) and its binding partners are useful in medical

imaging of sites expressing (II). (I) and (II) are useful in medical

collected involving aberrant protein expression or biological activity.

CC disorders involving aberrant protein expression or biological activity.

CC and to produce other types of data and products dependent on DNA and

diagnostics, forensics, gene mapping, identification of mutations

CC and to produce other types of data and products dependent on DNA and

diagnostic coding sequences of the invention.

monitoring the monitoring treatment of the conditions cited in (b), or monitoring treatment of bone tissue deposition.

Specific conditions include postmenopausal osteoporosis, glucocorticoid osteoporosis or male osteoporosis, osteoporosis, osteoporosis, determined and or male osteoporosis, and osteoporosis, skeletal disease linked to breast cancer, mastocytosis, osteoporosis), skeletal disease linked to breast cancer, mastocytosis, osteoplast differentiation associated CDNA marker of the invention. Osteoplast differentiation associated CDNA marker of the invention. Note: The sequence data for this patent did not form part of the printed appetitication, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                    Use of genes and their expression profiles associated with osteoblast differentiation for screening modulators bone formation, for diagnosing or treating e.g. osteoporosis, or as markers for the differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to genes and their expression profiles are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  screening modulators of precursor stem cell differentiation into soblasts, or bone tissue deposition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (b) diagnosing abnormal deposition of bone tissue, abnormal rate of osteoblast formation or osteoporosis; or
                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 128; 78pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ftp.wipo.int/pub/published_pct_sequences

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell WPI; 2001-656860/75 P-PSDB; ABB69624

Claim 1; SEQ ID NO 35663; 21pp + Sequence Listing; English. interactions -

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insectioides, theractions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1, Application US/0836051B
Sequence 1, Application US/0836051B
Patent No. 55620B
Patent No. 55620B
GENERAL INFORMATION:
APPLICANT: Dolwick, Kristin M.
APPLICANT: Carver, Lucy A.
TITLE OF INVENTION: Engineered Cells for Detecting Agonists to the Ah
TITLE OF INVENTION: Receptor
NUMBER OF SEQUENCES: 36
CORRESPONDENCE ADDRESS:
ADDRESSEE: Tilton, Fallon, Lungmus & Chestnut
                                     APPLICANT: Bradfield, Christopher Alan
APPLICANT: Bradfield, Christin Marie
APPLICANT: Doland, Alan
APPLICANT: Poland, Alan
TITLE OF INVENTION: Alan
TITLE OF INVENTION: Determining Human Risks To Environmental Pollutants
NUMBER OF SEQUENCES: 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 1; Length 3207,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1; Indels

GENERAL INFORMATION:

GENERAL INFORMATION:

TITLE OF INVENTION: Variants of alternative splicing

TITLE OF INVENTION: Variants of alternative splicing

TITLE OF INVENTION: Variants of alternative splicing

FILE REFERENCE: 129181.4 Compugen

CURRENT APPLICATION NUMBER: US/09/724,676A

CURRENT PILING DATE: 2000-11-28

NUMBER OF SEQ ID NOS: 97222

SOFTWARE: Patentin version 3.2

SEQ ID NOS: 97222

SEQ ID NOS 4305

LENGTH: 4060

TYPE: DAA

ORGANISM: Homo sapiens

/note="organ: pooled, Vector: pr773D-Pac (Pharmacia) with note="organ: pooled, Vector: pr773D-Pac (Pharmacia) with note="organ: pooled, Vector: pr773D-Pac (Pharmacia) with note="organ: pooled, Vector: site 1: Not I; Site 2: Eco RI; Equal amounts of plasmid DNA from three normalized in note of plasmid DNA from three normalized in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I: M.A.G.E. clones 297480-37239, 682632-687239, 726408-728711, and 72996-731399; Subtraction by Bento Soares and M. Ratima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BE513300 776 bp mRNA linear EST 07-AUG-2000 601315375F1 NIH_MGC_8 Homo sapiens cDNA clone IMAGE:3633810 5', mRNA sequence.
